

SURFACE WATERS  
OF  
THE REPUBLICAN BASIN  
(INCLUDING SMOKY HILL RIVERS)  
COLORADO

From Excerpts of Ground Water Report, Eastern Colorado  
by Glenn M. Schroeder of Colorado State Planning Commission

## CONFIGURATION

### ALTITUDE AND SLOPE

The Republican Basin lies in the form of a saucer, slightly tipped in an eastward slope. The western rim of the boundary has an elevation from 5400 feet to 4200 feet. Altitude of the rim at the southern state line is slightly over 4100 feet and the northern altitude is 3480 feet. Lowest point of drainage on the Colorado state line is 3318 feet in the North Fork Republican River Bed.

### DRAINAGE

The Republican Basin is drained by the following rivers and creeks in order of occurrence from north to south:

	DRAINAGE AREA	LENGTH OF COLORADO BED	GRADIENT
Sand Draw Creek	432 Sq.Mi.	22 miles	18.1 Ft. per mile
Frenchman Creek	705 " "	48 "	12.9 " " "
Red Willow Creek (Rock Creek)	576 "	68 "	9.9 " " "
North Fork Republican River	2360 "	61 "	12.8 " " "
Arickaree River	1512 "	112 "	17.8 " " "
South Fork Republican River	2340 "	79 "	20.2 " " "
North Fork Smoky Hill	310 "	40 "	10.1 " " "
South Fork Smoky Hill	382 "	30 "	9.6 " " "
Ladder Creek	<u>207</u> "	<u>16</u> "	17.1 " " "
Total	8824 "	476 "	

### RIVER UNDERFLOW

Valley land on the Colorado side of the State line with water within 25 feet of surface.	WIDTH IN MILES	LENGTH IN MILES
North Fork of Republican River	.50	15
Arickaree River	.25	10
South Fork of Republican River	.50	10

### REPUBLICAN BASIN BOUNDARY

The variance of subsurface drainage from the established Basin Boundary is shown in the shaded zones on the large geological map.

## SURFACE FLOW

FRENCHMAN AND SAND DRAW CREEKS. These two creeks are included in one measurement at a Nebraska gaging station at Culbertson. Unfortunately, these creeks flow 73 miles to this station. The bed of these streams is only an indentation in the Tertiary grit in Colorado. State line flow is intermittent. Across the state line the Pierre Shales outcrop and springs and seepage provide a steady flow. This flow of spring water and seepage, all Colorado originated from the Fox Hills formation, is the reason for the submission of the 16-year record at Culbertson. The Mean Annual value of the surface flow is estimated to be 15,000 acre feet. The Mean Annual value of spring flow and seepage is placed at 30,000 acre feet, not inclusive of the creek underflow.

RED WILLOW OR ROCK CREEK. The Red Willow Creek is generally dry at the state line. It drains into the North Fork of the Republican above Benkelman., Nebraska. Appears on most maps as Red Willow Creek but commonly known as Rock Creek.

NORTH FORK REPUBLICAN RIVER? The central part of the basin of the North Fork has no definite drainage pattern. Sand hills absorb the precipitation, and even in flood times, the flow does not travel far. The North Fork penetrates the Pierre Shales ten miles from the state line. Shale outcrops in the river bed a mile above this point, and springs from above the Pierre Shales, from here provide a constant flow. The North Fork measurement is by a Nebraska-U.S.G.S. gaging station at the state line. The 12-year record from the Nebraska report gives a Mean Annual flow of 37,291 acre feet.

ARICKAREE RIVER. The Arickaree drains a rolling country with a definite drainage pattern. The area is dry farmed and a large portion still has the native buffalo sod. Springs on the north side of the valley provide the flow. Stream is subject to short floods and has a torrential character. Tertiary is eroded to the Pierre Shales 27 miles west of the state line, and it is here that the springs provide a steady flow. The Nebraska-U.S.G.S. report records a 12-year Mean Annual flow of 23,458 acre feet. Gaging station at Haigler, Nebraska, 4 miles east of the state line.

SOUTH FORK REPUBLICAN RIVER. The basin of the South Fork is similar in character to the Arickaree. At the head waters, above Flagler, a large area of erosion of Tertiary to Pierre has a spring flow of considerable volume. The South Fork again penetrates the Pierre 17 miles east of the state line. Springs augment the flow here. Nebraska gaging station at Benkelman, Nebraska, representing 42 miles of river flow north and east of the state line gives a Mean Annual flow of 35,755 acre feet. As this flow is the northward hypotenuse of a triangle to a point 26 miles of the state line, and as after leaving Colorado the only additional flow comes from springs, patently Colorado water; it is reasonable to consider the entire flow as Colorado originated.

SMOKY HILL CREEKS. The two forks of the Smoky Hill and the Ladder Creek drain an area featured by the rising to the surface of the Pierre Shales. Beds of the Smoky underflow are forced to the surface in these dry drainage beds and provide small runs of water. The flow is intermittent. Gaging stations in Kansas are too far to provide a reliable basis for estimate. A reconstructed flow at state line, based on South Fork drainage, and on Cheyenne Wells precipitation records, is submitted. The twelve-year Mean Annual flow is estimated as 8,590 acre feet.

SPRING FLOW, SEEPAGE, RIVER UNDERFLOW. The semi-artesian water of the Fox Hill sandstones, shales and gravels provide the constant flow of Nebraska and Kansas streams through springs and seepage. A quantitative value is placed on these waters in the completed report on Ground Waters of the Republican Basin. Annual amount of river underflow, and recoverable water by townships are also evaluated.

TOTAL SURFACE FLOW.

	<u>MEAN ANNUAL</u>		
North Fork of Republican River	37,291	acre feet	" "
Arikaree River	23,458	"	"
South Fork of Republican River	35,755	"	"
Smoky Hill Creeks	8,590	"	"
Frenchman Creek, est.	<u>15,000</u>	"	"
Total	120,094	"	"

SOURCES. Various reports and papers of the U.S.G.S., Nebraska State Geological Reports, Department of Agriculture Surveys, Army Report #308, Winchester's Ground Water Survey.

GROUND WATER. The Republican Drainage Basin is in a "zone of flow" of low pressure artesian water. The annual safe reliable value of this water is set at ten times the surface flow. Estimates of state-line ground water flow and estimates by townships of safe recoverable water appear in the Republican Basin Ground Water Report. The above is not inclusive of river or creek underflow.
